Through a Parkdale Lens: Newcomer Families' Access to and Use of Child Care Support Resources in Toronto: Methodology

November 6, 2026

Through a Parkdale Lens: Newcomer Families' Access to and Use of Child Care Support Resources in Toronto: Methodology

Research Methodology

This study will use a qualitative methodology. Qualitative research explores a central phenomenon by collecting the words of a small number of participants in their natural settings and analyzing those words inductively, with the researcher as the primary instrument of data collection and analysis (Creswell & Guetterman, 2019). Its first strength is depth. Because only a few participants are involved, each account can be followed closely, whereas quantitative research tests hypotheses through predetermined variables and may miss unanticipated experiences (Mwita, 2022). A qualitative methodology therefore fits the purpose of this study, which is to explore how newcomer families at one Toronto child care centre describe learning about, and using or not using, family support resources that the centre offers or refers. The central research question asks how newcomer families describe their experiences of accessing and using or not using these resources. A family's path to a resource is made up of many small steps, such as reading a notice, asking an educator, or deciding that a form is too hard. Such details are more likely to surface in open conversation than in fixed survey items, so the study needs the in-depth information that qualitative research provides (Mwita, 2022).

Context is the second reason for this choice. Because qualitative data are collected in participants' natural settings (Creswell & Guetterman, 2019), the conditions around an experience become part of what is studied. All families in this study will deal with the same centre, the same City subsidy rules, and the same referral routes, yet they will do so in different languages and after different migration journeys. As these conditions shape access, they will be described alongside the families' own accounts. Families' accounts of one centre can also fill the gap in Toronto-specific evidence that the literature review identified. Since qualitative findings cannot be generalized (Mwita, 2022), the study seeks in-depth understanding of one centre.

The third reason is meaning-making. Grounded in constructivism, qualitative research seeks to understand how people make meaning of their social realities (Mwita, 2022). The sub-

questions ask (1) what helps or limits families in learning about resources, meeting requirements, and using or not using them, and (2) how families describe opportunities to share their needs, including needs related to language and culture, and how educators and the centre respond. Because these questions concern meaning and process, the barriers families face cannot be listed in advance as survey items. The literature review supports this choice. Survey research found that most parents had heard of the Canada-wide Early Learning and Child Care (CWELCC) system but held incorrect or limited information about it (Burns et al., 2025). However, a survey cannot explain how such gaps shape a family's decisions. Qualitative research, in contrast, revealed details that matter for practice, such as families relying on a provider's handwritten registration instructions (Fakhari et al., 2023). In this study, interviews will show how each family interprets eligibility rules and educators' explanations and how a decision to use or not use a resource is reached.

Because I will be the main instrument of data collection, I must state my position (Creswell & Guetterman, 2019). I am a Registered Early Childhood Educator who completed a field placement at the study centre. There, I saw a parent mistake the City's subsidy waitlist for the centre's enrollment waitlist, which prompted this study. Since I know these procedures well, I may assume that they are clear to families. I will keep a reflexive journal to record such assumptions and my research decisions, which will help me manage bias (Mwita, 2022).

Research Design

I will use a qualitative descriptive design. Qualitative description aims to give a full summary of events in the everyday language of the people who experienced them (Sandelowski, 2000, as cited in Hall & Liebenberg, 2024). Researchers who use this design stay close to participants' words and keep interpretation low, so the findings reflect what participants actually said. The design also studies experiences in their natural setting, without variables or a theory chosen in advance (Hall & Liebenberg, 2024).

This design fits my study for three reasons. First, a design should follow from the research question (Villamin et al., 2025). My sub-questions ask families what helped or limited

them, who explained the steps, and how educators responded to their language and cultural needs. These practical questions call for clear and detailed description. Second, qualitative description suits studies that need information directly from the people affected and that have limited time and resources (Hall & Liebenberg, 2024). A single-centre student project completed within one term fits that description. Third, findings that stay close to participants' words can inform practice (Villamin et al., 2025). Educators at the centre could use them to see where their explanations and referrals help families and where they fall short. Ilumin (2023) used the same design to describe immigrant families' child care experiences in Edmonton.

Participants, Recruitment and Sampling Plan

Participants and Recruitment

Participants

The participants will be four newcomer parents or primary caregivers. I define a newcomer family as an immigrant or refugee family with young children that has lived in Canada for five years or less (Massing et al., 2024). Each participant must (a) be 18 or older, (b) have arrived in Canada within the past five years, in any immigration category, (c) have a child enrolled at the study centre, (d) have been offered or referred at least one family support resource by the centre in the past 12 months, such as the City of Toronto child care fee subsidy, EarlyON, or settlement services, and (e) be able to take part in English or Mandarin, or with an interpreter.

These criteria select parents with direct and recent experience of the resources my questions ask about. Criterion (d) includes parents whether or not they went on to use the resource, because my literature review showed that being offered a resource does not mean using it. I will explore each family's account on its own terms. The study will not divide families into users and non-users, and it will not compare them.

I will exclude families from the room where I completed my placement and families of centre staff. My earlier role, or a parent's employment at the centre, could make these families feel obliged to take part (Villamin et al., 2025). I will also not ask about immigration status. Fee

subsidy applications require tax documents that undocumented families often cannot provide (Schmidt, 2026), and questions about status could discourage families from joining.

Recruitment Setting

I will recruit at a licensed child care centre in the Parkdale neighbourhood of west Toronto, where I completed my field placement. To protect families' privacy, I will not name the centre in this proposal or in any report. I chose this setting for two reasons. The centre already offers and refers family support resources, so its families have the experiences my questions ask about. Toronto's service plan also names child care settings as access points and identifies tax-filing requirements as a barrier to fee subsidy (Toronto Children's Services, 2025). A study in one centre can show how these city policies reach families. My placement gives me access to the centre, which makes recruitment feasible within the course timeline.

Recruitment Methods

I will first obtain approval from the George Brown Polytechnic Research Ethics Board (Canadian Institutes of Health Research et al., 2022) and written permission from the centre director. I will not contact any family before both are in place. I will then prepare a one-page flyer and a letter of information in plain English and translate them into Mandarin and other languages common at the centre. The materials will explain the purpose of the study, the total time of about 60 to 75 minutes in one meeting, the voluntary nature of taking part, the $25 gift card, and how to reach me.

The director will share the invitation through the parent newsletter, the notice board, and family cubbies, and staff will not approach families in person. As in Hardware et al. (2026), someone other than the lead researcher will distribute the invitation to avoid a conflict of interest. A notice from the director could still feel like a request from the centre. The flyer will therefore state that the centre will not know who takes part and that the decision will not affect any child's care. Interested parents will contact me directly by email, phone, or text. A 10-minute call will confirm eligibility, and parents will have at least 48 hours to decide after they receive the consent

form. If fewer than four parents respond by the middle of Week 1, the director will send one reminder.

Sampling Plan

Sampling Strategy. I will use purposive sampling, in which the researcher intentionally selects people who can help to understand the central phenomenon (Creswell & Guetterman, 2019). Here, that means newcomer parents whom the centre has offered or referred a resource. The sample will also be a convenience sample, because I will recruit willing and available parents at a centre I can already reach (Creswell & Guetterman, 2019). The purposive criteria decide who is eligible, and convenience explains where I will find them. Neither method aims to represent all newcomer families. Together, they reach parents who can give detailed accounts of this centre's resources.

Participant Selection. If more than four eligible parents respond, I will select them in order of contact and place the others on a waitlist. Only one adult from each family will take part.

Sample Size. I will include four participants. Qualitative studies commonly use about four to eight participants so that the researcher can explore each person's experience in detail (Creswell & Guetterman, 2019). Four participants also match the course requirement for individual projects. The findings will describe these four families' experiences and will not be generalized to all newcomer families.

Data Collection

Procedure

I will collect data through individual, semi-structured, in-depth interviews. The interview is my data collection method, and an interview protocol is my tool. The protocol will list open-ended questions with follow-up probes, and its flexible order will let me ask for more detail when a parent raises something new. I chose individual interviews over focus groups because income and subsidy are sensitive topics and families at one centre may know one another

(Villamin et al., 2025). Before Week 1, I will pilot the protocol with one newcomer parent from outside the study to check its wording, translation, and length.

Each participant will take part in one meeting of about 60 to 75 minutes at a time the family chooses. Families can meet in a private room at the centre outside drop-off and pick-up times, on Zoom, or by phone. Those who join online may turn off the camera and use a pseudonym, as in Hardware et al. (2026). I will interview Mandarin speakers myself. For other languages, a trained interpreter who signs a confidentiality agreement will join, so that meaning is not lost in translation (Ilumin, 2023). Each meeting will follow three steps:

1. **Consent (about 10 minutes).** I will go through the letter of information in the parent's language and answer any questions. The parent will then sign the consent form or give recorded verbal consent.
2. **Background form (about 5 minutes).** The parent will note years in Canada, children's ages, home language, and the resources the centre offered. The form will not ask about immigration status or income.
3. **Interview (45 to 60 minutes).** With permission, I will audio record the interview. The questions will follow the three themes of my literature review. Parents will describe how they learned about a resource and what they understood about eligibility and applying. They will explain who helped them, such as educators, settlement workers, or relatives, and what that help involved. They will talk about what led them to use or not use the resource. Finally, they will describe whether they could raise needs linked to their language and culture, how educators responded, and what they would suggest the centre change. At the end, each parent will receive the $25 gift card and a list of community supports such as EarlyON and 211 Toronto.

Taking part is voluntary. Parents may skip any question or stop the interview at any time and will still receive the gift card. They may withdraw their data within one week after their interview, before I begin coding it, and their child's care will not be affected either way. I will remove names, use pseudonyms, and keep recordings and transcripts in encrypted, password-

protected files stored apart from the consent forms. Only I will hold the list that links pseudonyms to names. A small sample from one centre can make people identifiable, so my reports will not combine details such as country of origin and home language. I will also change or leave out any quotation that could identify a family (Villamin et al., 2025).

Timeline of Research Study

Table 1

Timeline of the Research Study

Period	Research activity	Main tasks
By December 2026	Ethics and preparation	Obtain ethics approval and the director's permission, translate materials, and pilot the interview protocol
Weeks 1 and 2	Recruit participants	Share the invitation, send one reminder if needed, screen parents, obtain consent, and schedule interviews
Weeks 2 and 3	Collect data	Begin interviews in Week 2, complete at least three of four (75%) by the end of Week 3, and transcribe each one soon after it ends
Week 4	Complete data collection	Conduct the last interview and begin initial coding
Week 5	Preliminary findings	Submit a summary of preliminary findings
Weeks 6 and 7	Complete analysis	Complete reflexive thematic analysis (Braun & Clarke, 2022) and submit the findings report by Week 7
Weeks 8 and 9	Refine findings	Review and refine the findings using feedback
Week 10	Presentation draft	Complete a draft of the presentation
Weeks 11 to 13	Revise	Revise the presentation and the final report
Week 14	Final submission	Submit the final report

Ethics approval must be in place before the term begins, because recruitment starts in Week 1 and interviews begin in Week 2. I will transcribe each interview soon after it ends and start coding in Week 4, so the preliminary findings will be ready in Week 5. Throughout the study, I will record decisions, changes, and challenges in my reflexive journal.
